How does it work?

The CatanDog's Tag is manufactured from jewellery grade zamak and is electromagnetically charged with an electromagnetic field at a frequency that reacts with the pets' natural electromagnetic field. This reaction creates scalar waves. Due to the permanent contact of the Tag with the pet, and the movement of the pet, the scalar waves create a bio-resonant field which repels the parasites which cause pets danger and discomfort.

The CatanDog's Tag is effective for multiple years!

How to use your CatanDog's Tag

Simply attach the CatanDog's Tag to the collar of the pet and wait for the tag activation. The CatanDog's Tag must be worn 24 hours a day. If the tag is removed from your pet, it will need to be reactivated. An important precondition for the CatanDog's tag to be activated within 30 days is that the animal must be completely free of ticks and fleas, including eggs and larvae, during the activation period. In the absence of this precondition, it may take longer for the tag to be activated, and results are not guaranteed.

Advice to owners

The CatanDog's Tag contains no chemical substances and is safe around puppies, kittens, and children. The CatanDog's Tag does not kill the parasite, but protects your pet by repelling parasites and preventing them from attaching themselves to the pet. If the pet has an existing flea or tick infestation, a veterinarian approved 1-month spot-on treatment must be used to kill all existing infestations during the 1st

month of tag activation. Various internal and external factors may affect the CatanDog's Tag's activation period, and in some rare cases it may take more than 30 days for the tag to be activated.
